Pick up: none

Today you will:

Finish notes on basic ecology and matter and energy
 Complete food web activity

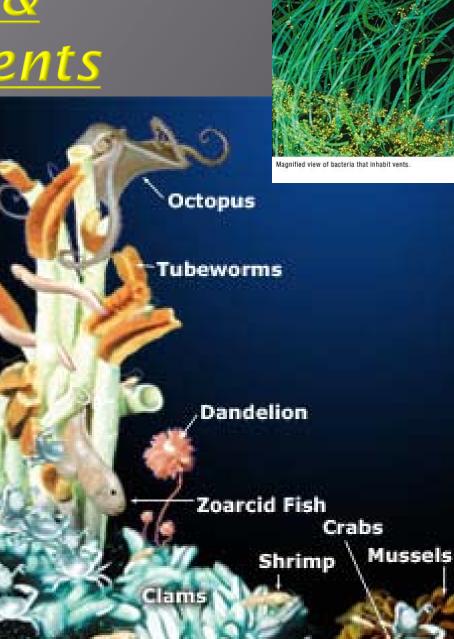

Homework/Planner:

Food Web Activity due Friday

<u>CHEMOSynthesis &</u> HydroTHermal Vents

- Deep ocean
- Living things evolved in <u>absence</u> of sunlight
- All due to <u>Bacteria</u> that convert chemicals (hydrogen sulfide) to food for animals

http://www.youtube.com/watch?v=D69hGv Microbes CsWgA&safety mode=true&persist safety

What is ecology?

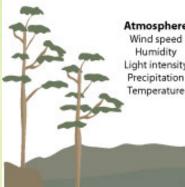

• Study of the interactions between organisms & their environment

Origin of the word "ecology"

- Greek origin
- OIKOS = household
- LOGOS = study of...
- Study of the "house/environment" in which we live.

Ecology is study of interactions between

- non-living components in the environment... Abiotic conditions in the Terrestrial Environment
 - light
 - water
 - wind
 - nutrients in soil
 - heat
 - solar radiation
 - atmosphere, etc.
- AND...
- Living organisms...
 - Plants
 - Animals
 - microorganisms in soil, etc.

Atmosphere Wind speed Humidity Light intensity

Surface Light intensity Moisture Aspect Slope

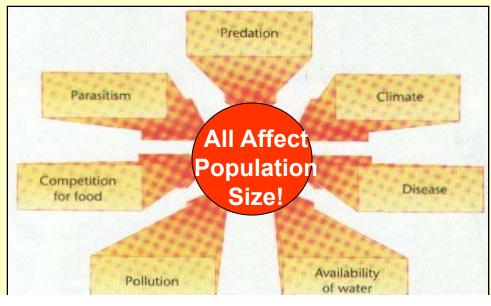

Soil Available nutrients Moisture pH Structure Temperature

•Biotic vs. Abiotic Factors = Limiting Factors

All the <u>living things</u>
that affect an organism.
<u>Ex:</u> Producers,
Consumers, &
Decomposers

Include <u>nonliving things</u> that affect an organism.
<u>Ex:</u> temperature, sunlight, pH, water, soil type, topography... They limit the kinds of organisms that live in an environment.

BOTH limit the kinds of organisms that live in an environment.

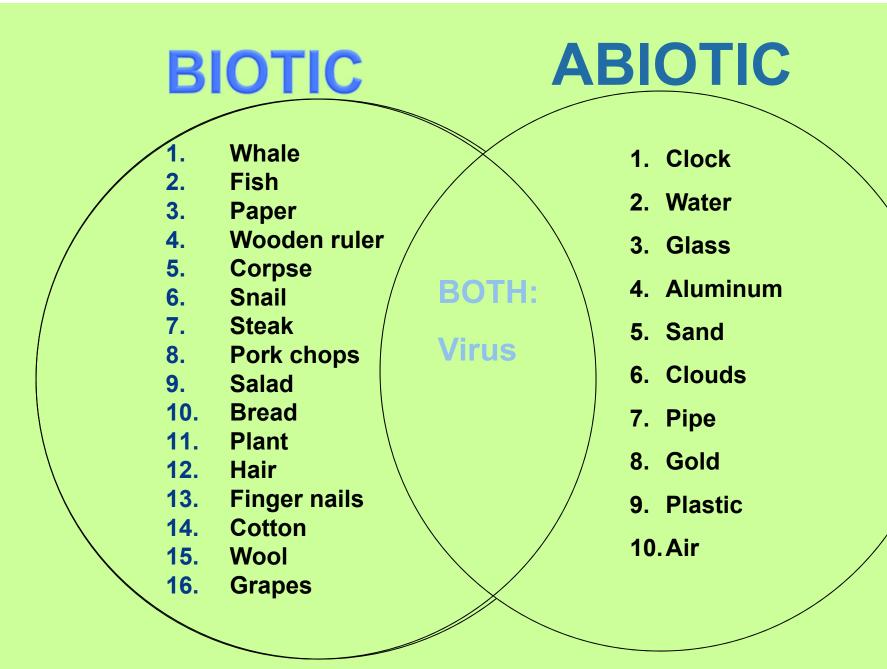

Make a Venn Diagram in your Notebook Biotic vs. Abiotic

•Whale	•Clouds	•Finger Nails
•Clock	•Corpse	•Pipe
•Water	•Snail	 Cotton Fabric
•Fish	•Steak	•Wool
•Paper	 Pork Chops 	•Gold
•Glass	•Salad	 Plastic
•Aluminum	•Bread	•Grapes
•Wooden Ruler	•Plant	•Air
•Sand	•Hair	•Virus

•<u>ABIOTIC</u> is something that has <u>never lived</u>

BIOTIC is something that is living or was once living:
 The 6 characteristics that living things have in common: growth, reproduction, respiration, complex chemical

reactions, cells, and movement.

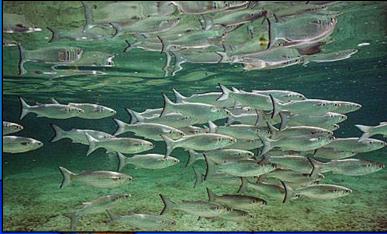

What Is a Population?

In population ecology a population is:

 a group of <u>ORGANISMS</u> of the same species inhabiting the same area...

 all members of a single species that live together in a specified geographic region

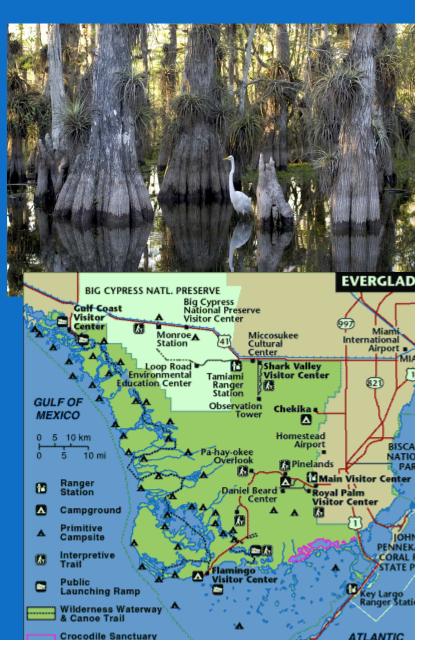

What Is a Community?

In ecology a community is:

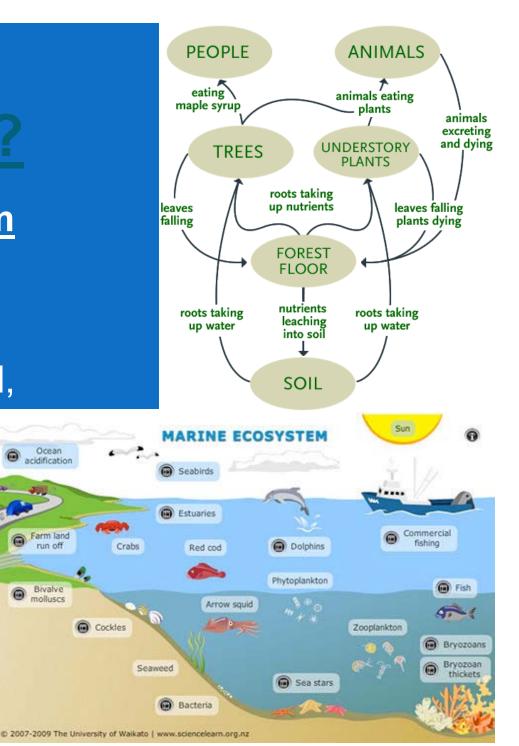

- a group of different species that live together in one area
- Examples are: groups of alligators, turtles, birds, fish, and plants that all live together in the Florida Everglades

<u>What Is an</u> Ecosystem?

In ecology an ecosystem includes:

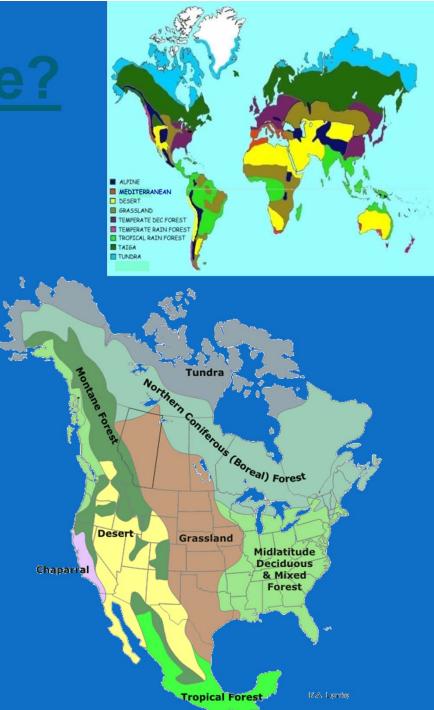

- All the organisms as well as the climate, soil, water, rocks and other abiotic factors in the environment.
- This could be a decaying log that may be part of a larger wetland ecosystem

What Is an Biome?

✓ In ecology a **biome** is:

- A major regional community of organisms.
- Characterized by the climate & plants that live there.

- <u>Producers</u>
 - Autotrophs
- <u>Consumers</u>
 - Heterotrophs:
 Herbivores,
 omnivores and
 carnivores

- fungi and bacteria

Abiotic conditions in the Terrestrial Environment Atmosphere Wind speed Humidity Light intensity Precipitation Surface Temperature Light intensity Moisture Aspect Slope Soil Available nutrients Moisture pH Structure Temperature

Packet pg 1 1a) an organism that can make its own food b) Palm tree, algae, diatoms, seaweed 2) From the sun 3) Ultimate source of food & energy for all consumers

Packet pg 2

4a) organisms that can't make their own food, must consume other organisms.

 b) Where they get energy: Herbivore, Carnivore, Omnivore, Decomposer

5) Eating plants, other animals, both or breaking down organic matter Food chains and webs

golden eagle pronghorn antelope coyote grasshopper sparrow bluestem grass grasshopper bacteria prairie dog funci conetiow

Packet pg 3

1)A sequence of who eats whom is called a <u>food</u> <u>chain</u>

<u>**2</u>a)**</u>

Algae=Level 1/ Producer

Sea turtle=Level 2/Primary consumer

Blue crab=Level 3/2nd consumer

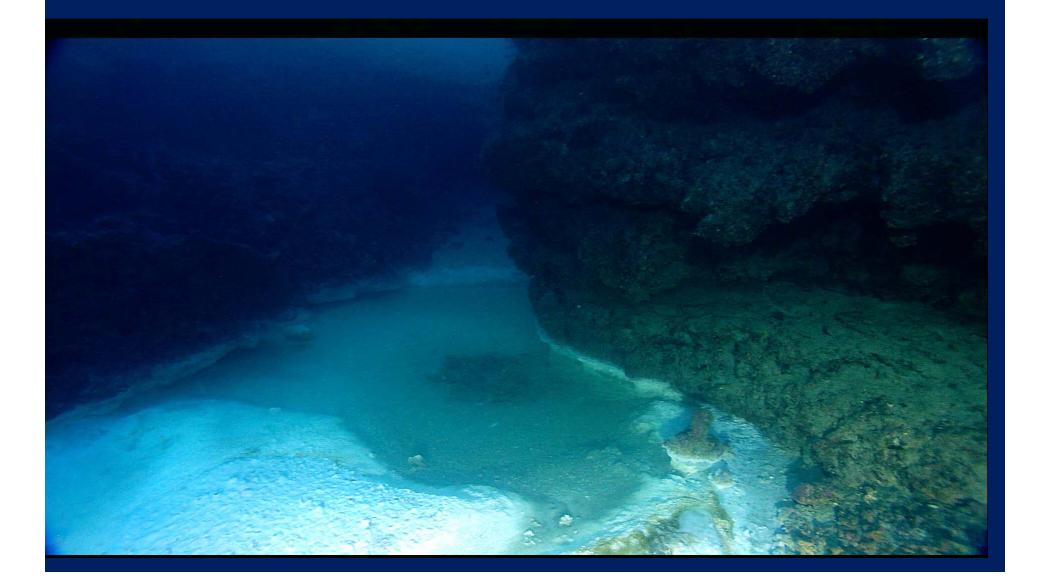

Osprey=Level 4/Tertiary

consumer

b) The sun

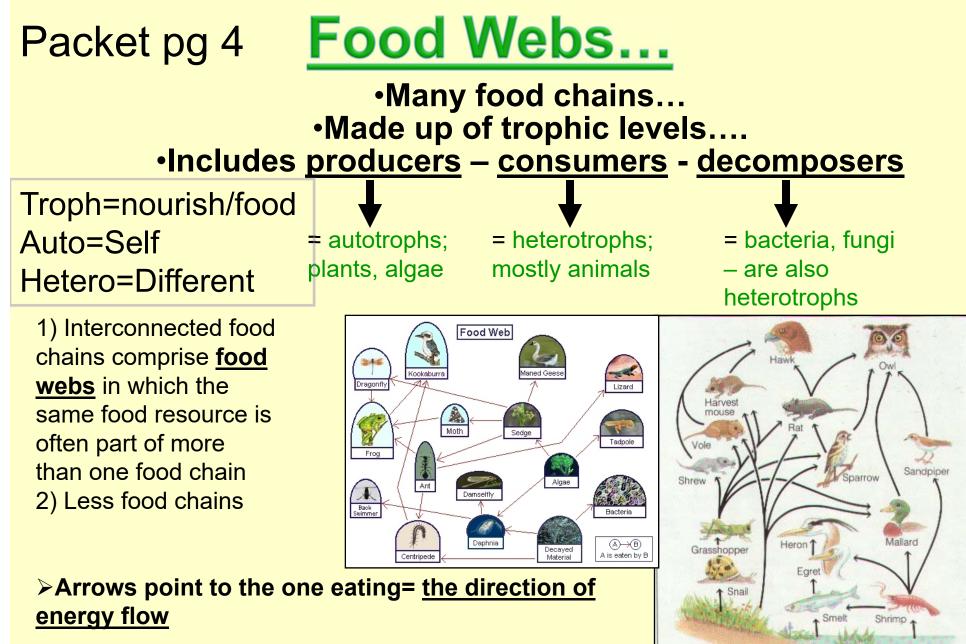

c) Energy is depleted

Deep Ocean Brine Pool

Deep Ocean Brine Pool

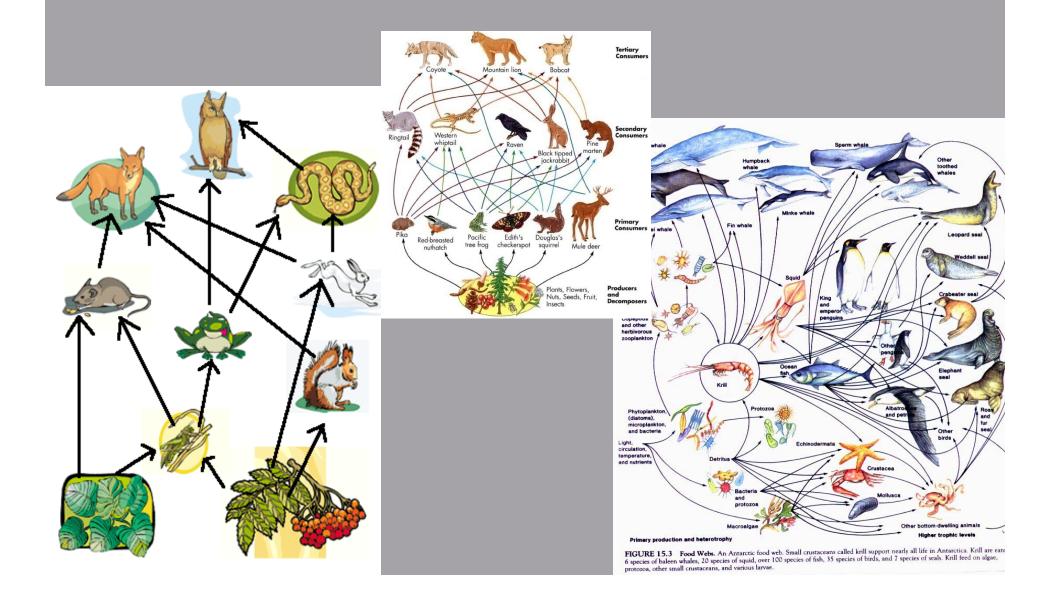

Terrestrial plants

Aquatic plants

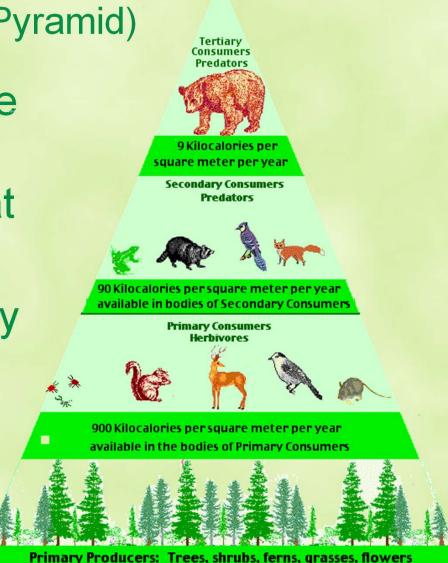

More Food Webs...

•More complex/complicated \rightarrow More realistic

Ecological Pyramid (aka Trophic

- An ecological pyramid shows the biomass (amt of life) of members at each trophic level
- Also shows energy losses at each transfer in trophic level
- Biomass=amt of living material

9000 Kilocalories per square meter per year available for Primary Consumers

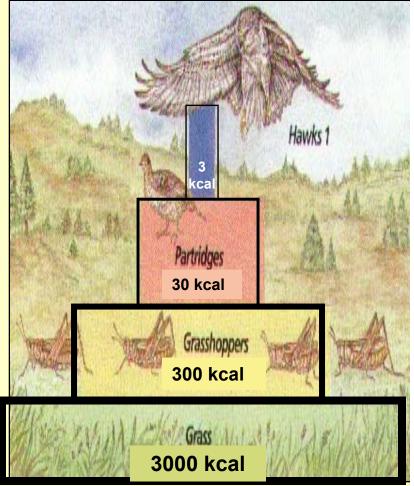

Trophic Level Pyramid

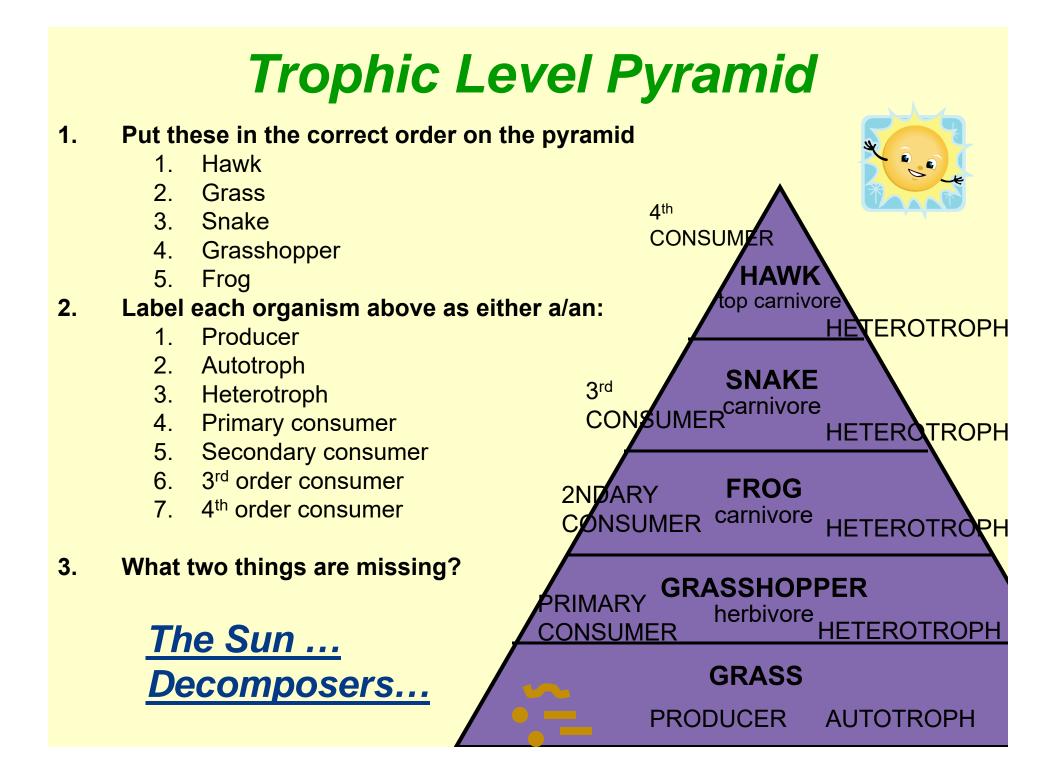

□NOTICE the #'s on the pyramid.....

□10% of the energy consumed is
available to the next = less energy
= less levels = fewer organisms at
top!

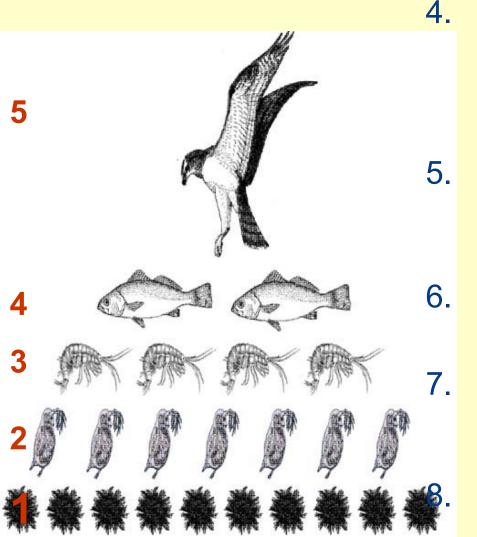

■Producers absorb energy from sun → only part of the energy from Sun becomes part of plants' structure→ The other part is used for.....

living & growing or **lost as HEAT**

Trends in Trophic Level Diagrams

- What do you notice about the numbers of organisms from bottom to top? Explain. Get fewer organisms, less energy available
- . How does the size of the organism change as you move through the levels? gets larger
 - What level in an energy pyramid is held by the producers? 1st
 - Where is there more 'biomass' & more energy in a trophic pyramid? 1st

What organism in the pyramid has the greatest energy needs?

Hawk Why?
